Inkroom

Detect brand violations. Verify every claim. Keep every piece of content on brand.

➢ The Problem:

- Organizations publish content through multiple channels and people.
- Employees, agencies, freelancers, and AI tools all create content.
- Each creator has a different understanding of the brand.
- Brand guidelines do not automatically enforce themselves.
- Errors slip through in five forms.

- The damage is usually invisible until a customer, competitor or regulator spots it. By then the content is already public.

➢ Scale Of The Problem:

- 81% of companies still struggle with off-brand content, despite believing in brand consistency. (2019 survey)
- 80% of marketers now use AI for content creation, increasing content volume.
- 70% of marketers have experienced AI-related incidents, including hallucinations, bias, or off-brand content.
- 40% of marketers have had to pull or pause ads due to AI-related issues.
- Only about one-third of brands, agencies, and publishers have formal AI governance tools in place. [link 1] [link 2]

➢ Why solving it matters:

- **Trust is fragile:** 62% of UK consumers trust marketing less since AI adoption. [lnk 3]
- **Legal risks:** Unsupported claims, misleading promises, and missing disclosures can trigger compliance issues.[link 4]
- **Speed vs. Control:** More AI content means more reviews or greater risk.
- **Costly corrections:** Fixing published mistakes costs more than catching them early.
- **Accessibility matters:** Inaccessible content excludes users and risks legal violations.
- **Wasted expertise**: Reviewers spend time fixing obvious errors instead of assessing high-risk cases.

Who is affected	How they are affected
1. Brand and marketing managers	Responsible for consistency but can't read everything before it goes out.
2.Content creators, social media managers and freelancers	Face rules they must memorise, get rejection without explanation, and redo work late.
3. Agencies	Juggle several clients' guidelines at once, with no single source of truth.
4. Legal, compliance and regulatory reviewers	Overloaded queues; they must verify claims by hand.
5. Design teams	Police logo, colour and font misuse manually.
6. Leadership and founders	Own the reputational and financial risk.

➢ Our Solution:

- An AI-assisted brand-governance platform that reviews content before publication.
- It checks every piece of content against the organisation's approved guidelines, facts and assets.
- It does not just reject content. It explains each issue, cites the rule or source involved, and suggests a fix that keeps the creator's original purpose.
- A team of AI agents does the checking, but people make every final decision.

➢ Value Proposition:

- **For Creators:** Clear reasons and ready fixes instead of unexplained rejections.
- **For Managers:** Consistency without reading every piece of content.
- **For Viewers:** Claims arrive pre-checked with sources, so they focus on high-risk cases.
- **For The Organization:** Fewer public mistakes, faster approvals and a full audit trail.

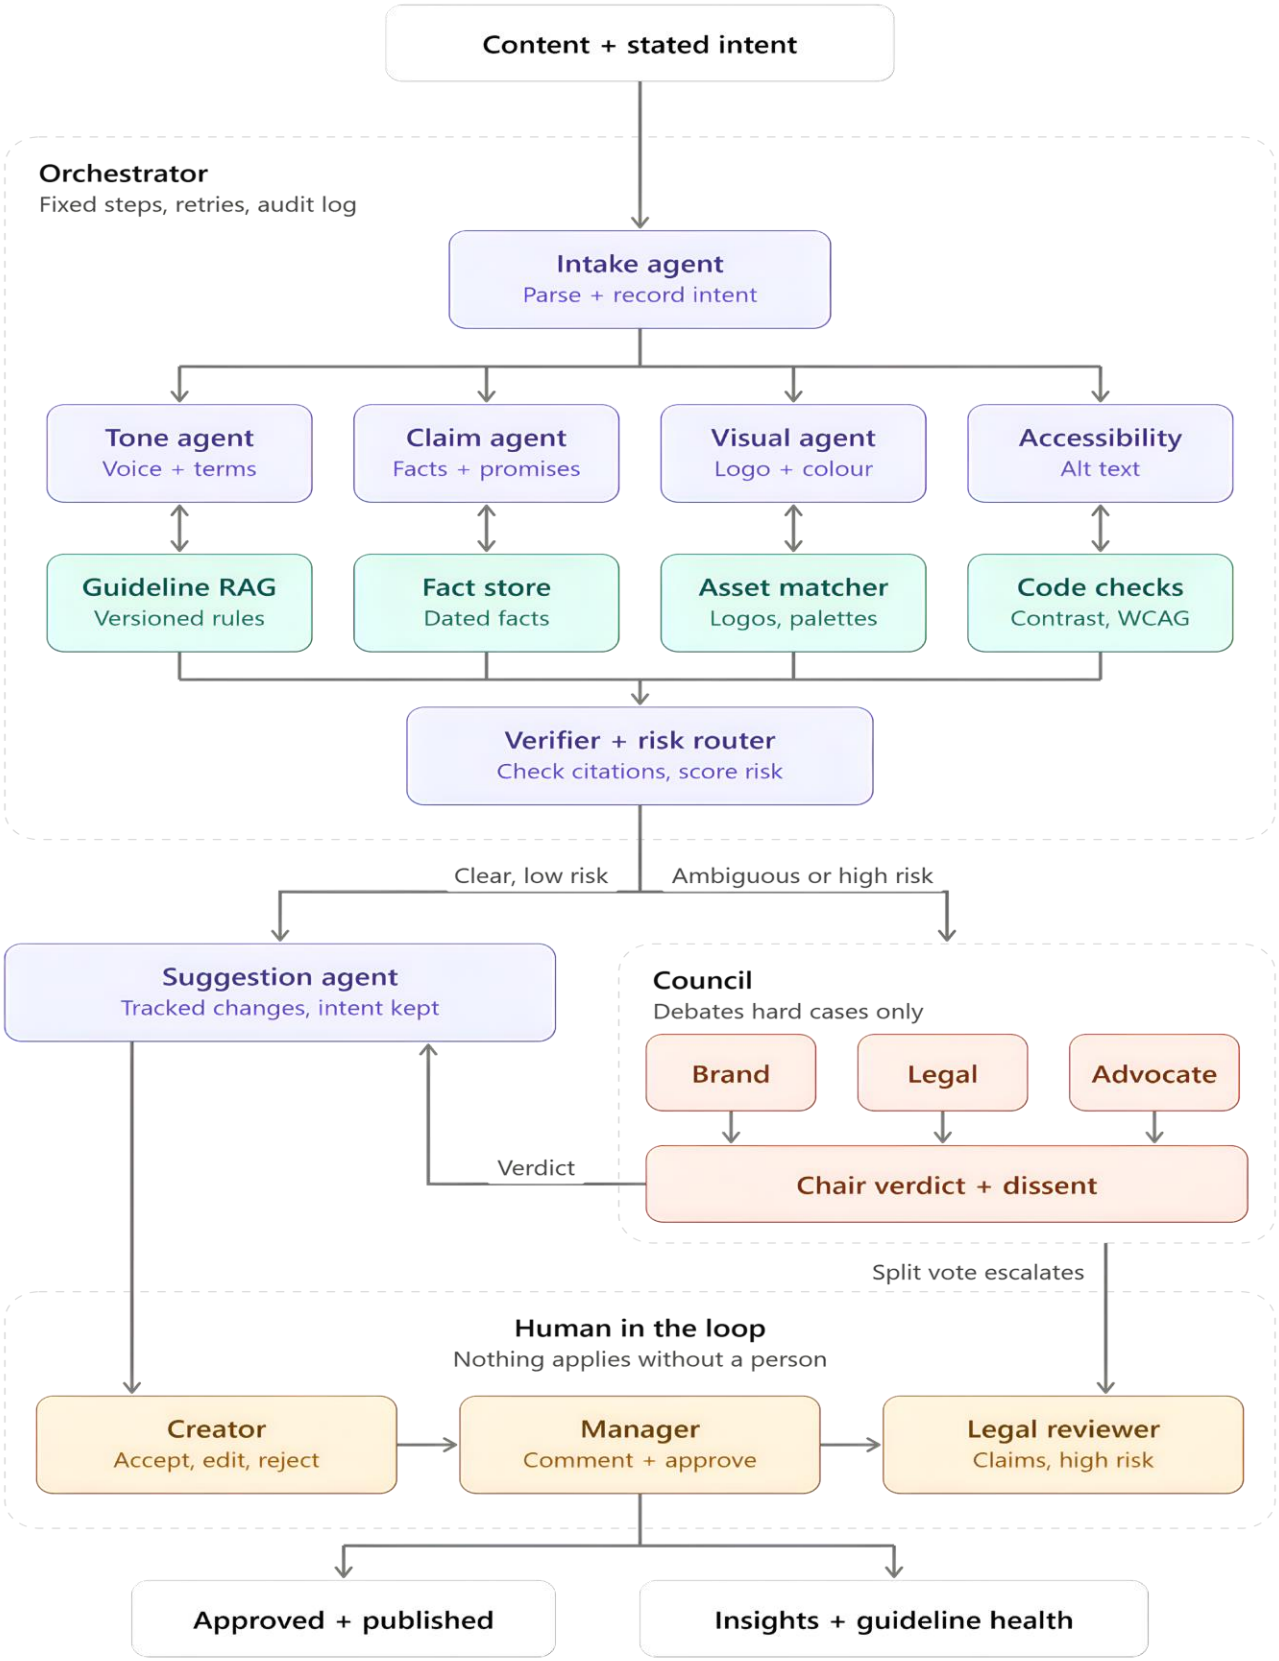

➢ Key Features:

Feature	What it does
Multi-format review	Checks text, images and documents.
Evidence-linked findings	Links every flag to an approved source or guideline.
Claim checker	Verifies factual and promotional claims against approved facts.
Visual & accessibility checks	Checks logos, colours, contrast, alt text and readability.
Intent-preserving suggestions	Suggests fixes without changing the creator's intent or auto-applying edits.
Review workflow	Manages comments, approvals, revisions and role-based access.
Guideline health insights	Identifies frequently broken and unclear rules.

➢ System Architecture:

➢ Technology Stack:

Frontend	React.js, Vite, Tailwind CSS
Backend	Node.js, Express.js
Database	PostgreSQL, pgvector
Document parsing	Mammoth.js (DOCX), PDF.js (PDF)
Orchestration	LangGraph, LangChain, LangSmith
AI models	OpenRouter
Charts & analytics	Recharts
Deployment	Vercel (frontend) + Render (backend)

➢ Implementation Plan:

Round 2	Round 3
• Implementation of orchestrator. • Implementing every agents from intake to visual. • Implementation of verifier and risk router for risk score and to check citations • Implementation of council agents • Implementation of RAG • Implementation of human in the loop	• Implementation of frontend • Implementation of backend and connect it with database • Deploy the project

➢ Team Detail:

Team Name: The Cartel

Team Members: Parth Wagh (L)
Utkarsh Nipane
Yuvraj Patel
Shripad Patnaik

➢ Team Members and Roles:

Parth Wagh	System Design, Agent implementation and orchestrations
Utkarsh Nipane	Frontend development
Yuvraj Patel	Frontend and deployment
Shripad Patnaik	Backend, database deployment
